PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 10/675,363	Applicant(s) COLIN ET AL.	
	Examiner WUTCHUNG CHU	Art Unit 2619	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 28 February 2008.
- 2a) ☒ This action is **FINAL**. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-24 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-24 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Amendment

1. This communication is in response to application's amendment filed on 2/28/2008. Claims 1-24 are pending.

Claim Rejections - 35 USC § 103

2. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1, 3, 4, 6, 8, 9, 11-12, 14, 16, 17, 19, 20, 22, and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Somekh et al., hereinafter Somekh, (US2003/0123466) in view of Rom et al., hereinafter Rom (US6252849).

Regarding claim 1, Somekh discloses a modem relay over packet based network (**see Somekh paragraph 21**) comprising:

- (a) transmitting data packages (**see Somekh paragraph 217 data packets**) from a plurality of data sources (**see Somekh figure 11 box 524**) in a first computer network to a first gateway (**see Somekh paragraph 217 gateway and figure 7 box 36a**);
- (b) transmitting the data packages from the first gateway to a second gateway (**see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets**);
- (c) transmitting the data packages from the second gateway to a plurality of data destinations (**see Somekh figure 14 box 812 and paragraph 217**) in a second computer network(**see Somekh paragraph 217 gateway and figure 7 box 36b**);
- (d) transmitting acknowledgement messages from the data destinations to the second gateway (see Somekh paragraph 226 modem 32b will respond with frames to each frame transmitted by gateway);
- (e) generating messages (**see Somekh paragraph 230 a packet which reports the delay due to network being still in the connection establishment negotiation stage**) at the second gateway and reception of acknowledgement messages by the second gateway based at least in part on the reception of acknowledgement messages by the second gateway (**see Somekh paragraph 228 when gateway 36B receives packet before the connection establishment negotiation stage on network is**

completed, gateway optionally waits to the end of the negotiation stage before transmitting frame).

(f) transmitting the messages from the second gateway to the first gateway **(see Somekh paragraph 230 gateway 36B transmitting to gateway 36A a packet which reports the delay due to network being still in the connection establishment negotiation stage).**

Somekh disclose all the subject matter of the claimed invention with the exception of:

- Pause message

Rom from the same or similar fields of endeavor teaches the use of:

Pause frame is provided to an information packet source by a downstream destination to inhibit transmission of information packets such as information frames by the information packet source to the downstream destination for a specified period of time **(see Rom col. 5 lines 8-12)**. Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the pause frame as taught by Rom in modem relay over packet based network of Somekh in order to enhance system efficiency by implementing flow control and providing a control signal **(see Rom col. 1 line 51 – col. 2 line 6)**.

Regarding claim 3, Somekh teaches further comprising the step of: (g) transmitting the pause messages from the first gateway to the plurality of data sources

(see Somekh paragraph 228 gateway 36A repeatedly transmits frames with guess values to modem 32A in order to stall the connection on the network and figure 11 illustrate more that one customers terminals).

Regarding claim 4, Somekh teaches step (a) is performed by a plurality of sending tasks created by the data sources **(see Somekh paragraph 258 a plurality of customers, and transmit to each other signals they receive on their twisted pairs and figure 11 box 524).**

Regarding claim 6, Somekh teaches the first gateway includes an input task and an output task, the second gateway includes an input task and an output task,

step (b) is performed by the output task of the first gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets),**

steps (c) and (e) are performed by the input task of the second gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets), and**

step (f) comprises transmitting the pause messages from the output task of the second gateway to the input task of the first gateway **(see Somekh paragraph 228-230).**

Regarding claim 8, Somekh teaches further comprising the steps of:

(g) sending messages with data package transfer information from the data sources to the first gateway (**see Somekh paragraph 258 a plurality of customers, and transmit to each other signals they receive on their twisted pairs and figure 11 box 524**);

(h) sending a message with the data package transfer information from the first gateway to the second gateway (**see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets**);

(i) sending messages with the data package transfer information from the second gateway to the data destinations (**see Somekh figure 14 box 812 and paragraph 217**); and

(j) checking the data package transfer information at the data destinations (**see Somekh paragraphs 291 and 293**).

Regarding claim 9, Somekh teaches computer program, stored on a tangible storage medium, for transferring data between computer systems, the program including executable instructions (**see Somekh paragraph 261 software**) that cause one or more computers to:

(a) transmitting data packages (**see Somekh paragraph 217 data packets**) from a plurality of data sources (**see Somekh figure 11 box 524**) in a first computer network to a first gateway (**see Somekh paragraph 217 gateway and figure 7 box 36a**);

- (b) transmitting the data packages from the first gateway to a second gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets);**
- (c) transmitting the data packages from the second gateway to a plurality of data destinations **(see Somekh figure 14 box 812 and paragraph 217)** in a second computer network**(see Somekh paragraph 217 gateway and figure 7 box 36b);**
- (d) transmitting acknowledgement messages from the data destinations to the second gateway **(see Somekh paragraph 226 modem 32b will respond with frames to each frame transmitted by gateway);**
- (e) generating messages **(see Somekh paragraph 230 a packet which reports the delay due to network being still in the connection establishment negotiation stage)** at the second gateway and reception of acknowledgement messages by the second gateway based at least in part on the reception of acknowledgement messages by the second gateway **(see Somekh paragraph 228 when gateway 36B receives packet before the connection establishment negotiation stage on network is completed, gateway optionally waits to the end of the negotiation stage before transmitting frame).**
- (f) transmitting the messages from the second gateway to the first gateway **(see Somekh paragraph 230 gateway 36B transmitting to gateway 36A a packet which**

reports the delay due to network being still in the connection establishment negotiation stage).

Somekh disclose all the subject matter of the claimed invention with the exception of:

- Pause message

Rom from the same or similar fields of endeavor teaches the use of:

Pause frame is provided to an information packet source by a downstream destination to inhibit transmission of information packets such as information frames by the information packet source to the downstream destination for a specified period of time **(see Rom col. 5 lines 8-12)**. Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the pause frame as taught by Rom in modem relay over packet based network of Somekh in order to enhance system efficiency by implementing flow control and providing a control signal **(see Rom col. 1 line 51 – col. 2 line 6)**.

Regarding claim 11, Somekh teaches further comprising the step of: (g) transmitting the pause messages from the first gateway to the plurality of data sources **(see Somekh paragraph 228 gateway 36A repeatedly transmits frames with guess values to modem 32A in order to stall the connection on the network and figure 11 illustrate more that one customers terminals)**.

Regarding claim 12, Somekh teaches software **(see Somekh paragraph 261 software)** and step (a) is performed by a plurality of sending tasks created by the data

sources **(see Somekh paragraph 258 a plurality of customers, and transmit to each other signals they receive on their twisted pairs and figure 11 box 524).**

Regarding claim 14, Somekh teaches software **(see Somekh paragraph 261 software)** and the first gateway includes an input task and an output task, the second gateway includes an input task and an output task,

step (b) is performed by the output task of the first gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets),**

steps (c) and (e) are performed by the input task of the second gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets),** and

step (f) comprises transmitting the pause messages from the output task of the second gateway to the input task of the first gateway **(see Somekh paragraph 218 gateway optionally notify each other on reception of a break frame by transmitting a break packet which states the reception of the break frame).**

Regarding claim 16, Somekh teaches software **(see Somekh paragraph 261 software)** and further comprising the steps of:

(g) sending messages with data package transfer information from the data sources to the first gateway **(see Somekh paragraph 258 a plurality of customers, and transmit to each other signals they receive on their twisted pairs and figure 11 box 524);**

(h) sending a message with the data package transfer information from the first gateway to the second gateway (**see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets**);

(i) sending messages with the data package transfer information from the second gateway to the data destinations (**see Somekh figure 14 box 812 and paragraph 217**); and

(j) checking the data package transfer information at the data destinations (**see Somekh paragraphs 291 and 293**).

Regarding claim 17, Somekh teaches a system (**see Somekh paragraph 130**) for storing and transferring data, the system comprising:

- a first gateway coupled to the data sources (**see Somekh figure 11 box 524 customers**);
- a second gateway coupled to the first gateway (**see Somekh figure 2 gateways box 36a and 36b**); and
- a plurality of data destination coupled to the second gateway (**see Somekh figure 14 box 812 computers**); where

(a) data packages are transmitted (**see Somekh paragraph 217 data packets**) from a plurality of data sources (**see Somekh figure 11 box 524**) to the first gateway (**see Somekh paragraph 217 gateway and figure 7 box 36a**);

- (b) the data packages are transmitted from the first gateway to the second gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets);**
- (c) the data packages are transmitted from the second gateway to a plurality of data destinations **(see Somekh figure 14 box 812 and paragraph 217);**
- (d) acknowledgement messages are transmitted from the data destinations to the second gateway **(see Somekh paragraph 226 modem 32b will respond with frames to each frame transmitted by gateway);**
- (e) generating messages **(see Somekh paragraph 230 a packet which reports the delay due to network being still in the connection establishment negotiation stage)** at the second gateway and reception of acknowledgement messages by the second gateway based at least in part on the reception of acknowledgement messages by the second gateway **(see Somekh paragraph 228 when gateway 36B receives packet before the connection establishment negotiation stage on network is completed, gateway optionally waits to the end of the negotiation stage before transmitting frame).**
- (f) transmitting the messages from the second gateway to the first gateway **(see Somekh paragraph 230 gateway 36B transmitting to gateway 36A a packet which reports the delay due to network being still in the connection establishment negotiation stage).**

Somekh disclose all the subject matter of the claimed invention with the exception of:

- Pause message

Rom from the same or similar fields of endeavor teaches the use of:

Pause frame is provided to an information packet source by a downstream destination to inhibit transmission of information packets such as information frames by the information packet source to the downstream destination for a specified period of time **(see Rom col. 5 lines 8-12)**. Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the pause frame as taught by Rom in modem relay over packet based network of Somekh in order to enhance system efficiency by implementing flow control and providing a control signal **(see Rom col. 1 line 51 – col. 2 line 6)**.

Regarding claim 19, Somekh teaches modem **(see Somekh paragraph 130)** and further comprising the step of:

(g) transmitting the pause messages from the first gateway to the plurality of data sources **(see Somekh paragraph 228 gateway 36A repeatedly transmits frames with guess values to modem 32A in order to stall the connection on the network and figure 11 illustrate more that one customers terminals)**.

Regarding claim 20, Somekh modem **(see Somekh paragraph 130)** and teaches step (a) is performed by a plurality of sending tasks created by the data

sources **(see Somekh paragraph 258 a plurality of customers, and transmit to each other signals they receive on their twisted pairs and figure 11 box 524).**

Regarding claim 22, Somekh modem **(see Somekh paragraph 130)** and teaches the first gateway includes an input task and an output task, the second gateway includes an input task and an output task,

step (b) is performed by the output task of the first gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets),**

steps (c) and (e) are performed by the input task of the second gateway **(see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets),** and

step (f) comprises transmitting the pause messages from the output task of the second gateway to the input task of the first gateway **(see Somekh paragraph 218 gateway optionally notify each other on reception of a break frame by transmitting a break packet which states the reception of the break frame).**

Regarding claim 24, Somekh teaches modem **(see Somekh paragraph 130)** and further comprising the steps of:

(g) sending messages with data package transfer information from the data sources to the first gateway **(see Somekh paragraph 258 a plurality of customers, and transmit to each other signals they receive on their twisted pairs and figure 11 box 524);**

(h) sending a message with the data package transfer information from the first gateway to the second gateway (**see Somekh paragraph 217 data signals received by gateways 36a and 36b are optionally forwarded to the other gateway in data packets**);

(i) sending messages with the data package transfer information from the second gateway to the data destinations (**see Somekh figure 14 box 812 and paragraph 217**); and

(j) checking the data package transfer information at the data destinations (**see Somekh paragraphs 291 and 293**).

5. Claims 2, 7, 10, 15, 18, and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Somekh and Rom further in view of Janakiraman et al., hereinafter Janakiraman, (2004/0196785).

Regarding claims 2 and 7, Somekh and Rom disclose all the subject matter of the claimed invention with the exception of:

- the first gateway includes a mailbox and an output task, the data packages are transmitted to the mailbox in step (a), and the output task retrieves data packages stored in the mailbox.
- (g) transmitting acknowledgement messages from the first gateway to the data sources; and (h) counting the acknowledgement messages received at each data source.

Janakiraman from the same or similar fields of endeavor teaches the use of packet buffer and packet sending process, that packet have been buffered, then the process attempts to send these packets, and NumAckPending which if the packet can be sent, then NumAckPending is increment (**see Janakiraman paragraphs 27 and 28**), Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the packet buffer and packet sending process as taught by Janakiraman in the modified modem relay over packet based network of Somekh and Rom in order to reduce the utilization of the network fabric (**see Janakiraman paragraph 6**).

Regarding claims 10 and 15, Somekh and Rom teaches software (**see Somekh paragraph 261 software**) and discloses all the subject matter of the claimed invention with the exception of:

- the first gateway includes a mailbox and an output task, the data packages are transmitted to the mailbox in step (a), and the output task retrieves data packages stored in the mailbox.
- (g) transmitting acknowledgement messages from the first gateway to the data sources; and (h) counting the acknowledgement messages received at each data source.

Janakiraman from the same or similar fields of endeavor teaches the use of packet buffer and packet sending process, that packet have been buffered, then the process attempts to send these packets, and NumAckPending which if the packet can

be sent, then NumAckPending is increment (**see Janakiraman paragraphs 27 and 28**), Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the packet buffer and packet sending process as taught by Janakiraman in the modified modem relay over packet based network of Somekh and Rom in order to reduce the utilization of the network fabric (**see Janakiraman paragraph 6**).

Regarding claims 18 and 23, Somekh and Rom teaches modem (**see Somekh paragraph 130**) and discloses all the subject matter of the claimed invention with the exception of:

- the first gateway includes a mailbox and an output task, the data packages are transmitted to the mailbox in step (a), and the output task retrieves data packages stored in the mailbox.
- (g) transmitting acknowledgement messages from the first gateway to the data sources; and (h) counting the acknowledgement messages received at each data source.

Janakiraman from the same or similar fields of endeavor teaches the use of packet buffer and packet sending process, that packet have been buffered, then the process attempts to send these packets, and NumAckPending which if the packet can be sent, then NumAckPending is increment (**see Janakiraman paragraphs 27 and 28**), Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the packet buffer and packet sending process as taught by

Janakiraman in the modified modem relay over packet based network of Somekh and Rom in order to reduce the utilization of the network fabric (**see Janakiraman paragraph 6**).

6. Claims 5, 13, and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Somekh and Rom in view of Lindhorst-ko et al. (US2002/0075873).

Regarding claim 5, Somekh and Rom disclose all the subject matter of the claimed invention with the exception of:

- (g) adding sequence identifiers to the data packages in step (a);
- (h) checking the sequence identifiers added in step (g) at the first gateway;
- (i) adding sequence identifiers to the data packages in step (c); and
- (j) checking the sequence identifiers added in step (i) at the data destinations.

Lindhorst-ko et al. from the same or similar fields of endeavor teaches the use of each data packets for transmission is tagged with a sequence number by the source node. The destination node receives the data packets transmitted over the paths, and reconstructs the traffic from the received data packet (**see Lindhorst-ko et al. paragraph 35 and 36**). Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the tagging data packets with a sequence number, and reconstructing the traffic from the received data packet as taught by Lindhorst-ko et al. in the modified modem relay over packet based network of Somekh and Rom in

order to enhance reliability and implement and is scalable for selectable degrees of reliability against network faults (**see Lindhorst-ko et al. paragraphs 3 and 4**).

Regarding claim 13, Somekh and Rom teaches software (**see Somekh paragraph 261 software**) disclose all the subject matter of the claimed invention with the exception of:

- (g) adding sequence identifiers to the data packages in step (a);
- (h) checking the sequence identifiers added in step (g) at the first gateway;
- (i) adding sequence identifiers to the data packages in step (c); and
- (j) checking the sequence identifiers added in step (i) at the data destinations.

Lindhorst-ko et al. from the same or similar fields of endeavor teaches the use of each data packets for transmission is tagged with a sequence number by the source node. The destination node receives the data packets transmitted over the paths, and reconstructs the traffic from the received data packet (**see Lindhorst-ko et al. paragraph 35 and 36**). Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the tagging data packets with a sequence number, and reconstructing the traffic from the received data packet as taught by Lindhorst-ko et al. in the modified modem relay over packet based network of Somekh and Rom in order to enhance reliability and implement and is scalable for selectable degrees of reliability against network faults (**see Lindhorst-ko et al. paragraphs 3 and 4**).

Regarding claim 21, Somekh and Rom teaches a modified modem a modem **(see Somekh paragraph 130)** and disclose all the subject matter of the claimed invention with the exception of:

- (g) adding sequence identifiers to the data packages in step (a);
- (h) checking the sequence identifiers added in step (g) at the first gateway;
- (i) adding sequence identifiers to the data packages in step (c); and
- (j) checking the sequence identifiers added in step (i) at the data destinations.

Lindhorst-ko et al. from the same or similar fields of endeavor teaches the use of each data packets for transmission is tagged with a sequence number by the source node. The destination node receives the data packets transmitted over the paths, and reconstructs the traffic from the received data packet **(see Lindhorst-ko et al. paragraph 35 and 36)**. Thus, it would have been obvious to one of ordinary skill in the art at the time of the invention to use the tagging data packets with a sequence number, and reconstructing the traffic from the received data packet as taught by Lindhorst-ko et al. in the modified modem relay over packet based network of Somekh and Rom in order to enhance reliability and implement and is scalable for selectable degrees of reliability against network faults **(see Lindhorst-ko et al. paragraphs 3 and 4)**.

Response to Arguments

7. Applicant's arguments with respect to claims 1-24 have been considered but are moot in view of the new ground(s) of rejection.

With regard to applicant's remark for claim 1 (pages 7-8), applicant submit that Somekh does not teach or suggest generating pause messages based at least in part on the reception of acknowledgement messages by the second gateway.

Somekh in paragraph 228 disclose that gateway 36B optionally waits to the end of the negotiation stage before transmitting frame as corresponds to step e) generate pause messages at the second gateway based at least in part on the reception of acknowledgement messages by the second gateway. Thus Somekh teaches that gateway 36B can transmit a frame before the response from modem 32B (paragraph 226), where it is also disclose in paragraph 230 that a packet which reports the delay due to network would be transmitted from 36B to 36A which is to stall the connection on network (paragraph 228).

Although Somekh's packet which report the delay does not very clearly states that it function as a pause message, a new prior art is applied. Rom teaches Pause frame is provided to an information packet source by a downstream destination to inhibit transmission of information packets such as information frames by the information packet source to the downstream destination for a specified period of time (**see Rom col. 5 lines 8-12**). Therefore Somekh and Rom teach the limitations and rejection respectfully remains.

Conclusion

8. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Ben-Yehezkel et al. (US2002/0165973); Mostafa (US2002/0073205); Taguchu et al. (US2004/0024808); Souder et al. (US6889231).
